Single–Sideband Phase Noise

Phase noise is specified and guaranteed only with internal reference. In External Reference mode, the phase noise of the external supplied reference, and the selected external reference bandwidth, will dictate the instrument phase noise performance. Phase noise is not degraded when adding high power Option 15. Phase noise measured at +10 dBm for frequencies ≤43.5 GHz; otherwise, measured at + 5 dBm or maximum power, whichever is lower.

Premium Phase Noise, CW (Option 23)

A user-controlled switch routes signal directly from the synthesizer core to a Rear Panel RF output connector, eliminating the noise contribution of power amplifiers and leveling circuits. Output is 2 GHz to 20 GHz, unleveled, nominally +14 to +23 dBm. Phase noise at intermediate offsets is reduced by about 3 dB relative to front panel output. (Front panel RF output is disabled while the Rear Panel output is in use).

Millimeter-wave Frequency Coverage

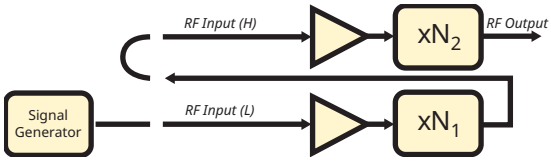
Millimeter-wave Multiplier 2000-2087-R Through 2000-2098-R Series

2000-2087-R through 2000-2098-R series of waveguide output multipliers are available for banded frequency coverage from 50 GHz (WR15) to 1.1 THz (WR1.0). These modules offer high test port power, voltage-controlled RF attenuation, and TTL controlled ON/OFF modulation rates to a few kHz as standard. The frequency multiplier modules are intended to be used in CW mode and do not preserve AM.

Frequency multiplier modules have two multipliers that can be configured to allow input signals in two frequency bands:

- Low frequency input for < 20 GHz and 10 dBm input level

  In this configuration the RF output from Rubidium is input into the K(f) input port on the rear panel of the multiplier module. The port is designated as RF(L). The low frequency band input configuration uses both N_1 and N_2 multipliers, as shown below.



- High frequency input for < 50 GHz and 0 dBm input level

  In this configuration the RF output from Rubidium is input into the 2.4 mm(f) input port on the rear panel of the multiplier module. The port is designated as RF(H). The high frequency band input configuration uses an N_2 multiplier, as shown below. This results in a lower multiplication factor and reduces unwanted subharmonic signals within the band.

a. For low frequency input operation a K(f) to K(m) RF cable is included as standard.

b. For high frequency band input operation, a 34VFKF50A V(f) to K(f) adapter and a V120MM RF cable are required and must be ordered separately. The 34VFKF50A adapter is used at Rubidium output to convert to a V(f). This is then connected to 2.4mm (f) input port of multiplier module with a V120MM RF cable.

c. It is recommended to turn the power ON only after all connections to the multiplier are made, such as RF input, AC inputs, and DC inputs. When turning power OFF, it is recommended to turn OFF the RF input from signal generator first, and then turn OFF/disconnect all other inputs and outputs of the multiplier.

A sample curve of UCA control voltage vs. output power is shown below. The curve is subject to some variation due to measurement conditions, such as temperature and load impedance, and should be considered as representative only.
